

# Sulava uses Copilot to bring customers into the AI era

## Modernization begins with Copilot

Sulava, a consulting partner specializing in Microsoft technologies, faced a high-stakes challenge: putting their AI adoption best practices to the test with one of their best customers, Kuopion Energia. The Finnish energy company wanted to enhance operational efficiency and processes—and asked Sulava to drive the effort. Sulava's expertise in AI and digital transformation enabled Kuopion Energia to leverage advanced AI tools like Microsoft 365 Copilot and Copilot Studio across the business.

Kuopion Energia experienced outdated and manual processes in administration and communication, slow adoption of new technologies, and the need for real-time reactive capacity in energy production. Their sales teams also required more efficient methods to target and compare market trends to improve sales performance.

To address this, Sulava implemented a structured Copilot adoption program, including training sessions, workshops, and leveraging Microsoft funding to cover costs. They focused on educating employees, identifying use cases, and creating AI agents to streamline processes.

Sulava's approach helped Kuopion Energia improve communication, enhance sales strategies, and optimize energy production through real-time data analysis. The collaboration resulted in a successful Copilot implementation, setting a model for future AI integrations.

Sulava is a pioneer in the revolution of working life and one of Finland's most competent expert and training companies—specializing in Microsoft solutions and cloud service implementations. Sulava is extremely passionate about modern working culture and is at the forefront of digital service business. Learn more on [their site](#).

## Leave the past behind with artificial intelligence

Kuopion Energia wanted to integrate AI solutions across their business—from administration to sales and energy production teams—to update their processes and increase efficiency.

## Copilot agents enable innovative solutions

Sulava used a three-fold approach—focusing on learning, innovation, and solutions—leveraging hands-on workshops to educate Kuopion Energia, identify use cases, foster innovation, and create agent solutions.

## Artificial intelligence creates real results

- Improve administration and communication methods, allowing them to react faster
- Achieve better results for targeted sales and comparing competitor activities
- React quickly to market trends, improving analysis and decision-making

# Collaboration and patience—the keys to success

## How Sulava did it

Sulava's Copilot Adoption Service focuses on three key areas—educating individuals, finding use cases for team benefits, and creating agent solutions for business benefits.

### Back to basics

Sulava starts their Copilot adoption plan with educating individuals and helping them acquire the necessary skills to use Copilot effectively. This ensures that users are well-prepared to leverage Copilot's capabilities in their daily tasks.

### Ponder the possibilities

By focusing on finding use cases within Copilot that provide individual and team benefits, Sulava can dig into areas for innovation like creating agent solutions for clients.

### Foster the future

Sulava collaborated with Kuopion Energia to create business-level ideas and solutions that provide tangible benefits to employees and the business.

When management understands the opportunities offered by technology and provides the operating conditions, the business can be genuinely developed in a modern way.

Kuopion Energia

## Human intuition leads to AI adoption

Sulava's work with Kuopion Energia involved a comprehensive approach to adopting Copilot, which required the very human skills of patience and persistence. Initially, the adoption process was slow due to factors like a lack of Finnish language support and the need for employees to familiarize themselves with the new technology. It wasn't until a solid foundation was set that Copilot Studio was introduced to support the creation of agent solutions and enhance the overall Copilot adoption experience.

Sulava remained patient and continued to demonstrate the benefits of Copilot through structured training programs and hands-on workshops. These workshops—provided to different departments within Kuopion Energia—allowed participants to share challenges and collaboratively find solutions. After the workshops, solutions were documented and an implementation strategy determined. This approach eventually led to a change in mindset towards AI adoption. Employees began to think about how AI and Copilot could solve their everyday challenges.

## Trust the process for successful Copilot implementation

According to the Sulava team, successful Copilot adoption required trust in their tried-and-true adoption strategies. By educating employees on Copilot basics and identifying use cases—which helped users see the value of Copilot and become more interested in its capabilities—Sulava followed its own best practices to overcome initial AI hesitation and prove value to individuals and teams.
