

Partner FAQ — Microsoft Scout

LAST EDITED

May 28, 2026

INTRODUCTION

This document provides early information about Microsoft Scout, Microsoft’s Autopilot. Microsoft Scout is an always-on agent that keeps work moving, taking action without needing to be prompted each time.

Microsoft Scout is currently in private preview. A local desktop Microsoft Scout app is currently in Frontier.

1. OVERVIEW

What is Microsoft Scout?

Microsoft Scout is the first example of a new category of agents called Autopilots. Autopilots are always-on agents that work autonomously, with their own identity, and act on your behalf. Microsoft Scout is an always-on agent that keeps work moving, taking action without needing to be prompted each time. It's designed to work alongside you and proactively take work off your plate. It learns your goals, adapts to your daily work patterns, and stays connected to what matters—monitoring progress, identifying issues early, and helping move work forward. For example, it can detect when a calendar is overbooked and propose specific changes before the week begins or identify when a decision is stalled and draft a targeted follow-up to unblock it.

Microsoft Scout is integrated into the places where work already happens. You interact with it in Teams and use the desktop app to manage permissions, review activity, or take action on your device. Once set up, it begins identifying opportunities to step in and reduce overhead, without you needing to ask. Microsoft Scout is built on Microsoft's foundation of enterprise identity, governance, and security, allowing the agent to act while remaining bound by enterprise control and oversight.

Why are we building this? What problem does it solve?

Until today, AI assistants have been fundamentally reactive, only acting when prompted. The release of OpenClaw marked a shift in what AI could do — not just respond, but reason across a task, take action on your behalf, and follow through until the work was actually done. And the true value is the speed at which the technology learns and adapts over time, adjusting reasoning and actions based on its evolving understand of a user's role and priorities.

Microsoft Scout builds on OpenClaw technology to provide users with an always-on, proactive, personal agent, that adapts to each user's individual needs. Microsoft Scout is built to handle the continuous, behind-the-scenes work that keeps things moving—triaging, preparing, coordinating, and following up—so work actually progresses without constant input, and you can spend more time on more strategic activities, vs. spending time on the 'work around work'.

When will customers see this? What's the timeline?

We are using a phased release cycle to bring capabilities to customers in Frontier sooner. Our current sequencing plans are as follows:

- 6/2, Frontier Private: select group of customers get the broader Microsoft Scout experience
- 6/2, Frontier Public: In parallel, we are offering Frontier organizations the opportunity to use an early Microsoft Scout desktop app experience so that we can learn and build together as we transition to an always-on agent running in our

Microsoft 365 service. See “The Frontier Public Product Experience” section for more details.

- **Post-Build:** adjustments to Frontier Public experience, as well as GA timelines have not yet been defined.

How will the agent show up in Teams, Outlook, Calendar, and OneDrive?

Microsoft Scout shows up across Microsoft 365 as a persistent, addressable agent with its own identity—meaning it has its own presence, mailbox, calendar, and files, and can operate within the tools you already use. You interact with your agent primarily in Teams as a teammate you can message, @mention, or bring into conversations and meetings. In Outlook, it operates with its own mailbox and clear identity, so it can send, receive, and manage communication transparently. It maintains its own calendar alongside yours, helping coordinate schedules, prepare for meetings, and run recurring habits that stay visible and adjustable.

Microsoft Scout also creates and manages content in OneDrive, sharing drafts into your existing folders so work flows naturally into your collaboration spaces. And across tools like To Do and Planner, it works with you on shared tasks—helping track progress, coordinate follow-through, and keep work moving.

2. THE FRONTIER PUBLIC PRODUCT EXPERIENCE

When will Microsoft Scout be available?

We are using a phased release cycle to bring capabilities to customers in Frontier sooner. Our current sequencing plans are as follows:

- **6/2, Frontier Private:** select group of customers get the **broader** Microsoft Scout experience
- **6/2, Frontier Public:** In parallel, we are offering Frontier organizations the opportunity to use an early Microsoft Scout desktop app experience so that we can learn and build together as we transition to an always-on agent running in our Microsoft 365 service.

Is Microsoft Scout available worldwide?

The Microsoft Scout app will be available worldwide, but in English language only. We will communicate additional timelines for localization at a later date.

How does a Frontier Public customer access this?

There are several steps required to enable Microsoft Scout in Frontier - for the full process please refer to aka.ms/microsoft-scout-docs. At a high level:

1. Users must be enrolled in Frontier Public and have app installation permissions to be able to download the app
2. Relevant admins must configure Intune enablement: intune.microsoft.com

3. Relevant admins must opt-in and explicitly attest acceptance of associated terms and conditions: aka.ms/msscout-m365admin
4. Users must have a GitHub Copilot license (Enterprise or Business), used for consumptive metering: [Setting up GitHub Copilot for your organization - GitHub Enterprise Cloud Docs](https://docs.github.com/en/enterprise-cloud/enterprise-cloud-docs/setting-up-github-copilot-for-your-organization)
5. Only when all steps are completed will the user be able to log in to, and use, the app

What are some “wow” moments or key use cases?

While we expect every user to use the app differently, depending on their role and priorities, we have collected some common use cases, tips, and tricks, that customers can leverage:

- **Cross-system workflows:** Lean on Microsoft Scout as the connective tissue across complex workflows or automations that need to combine M365/Work IQ data with custom services (MCP servers, scripts, GitHub, internal APIs) — anything no single tool covers end-to-end. It can call your scripts, browse with Playwright, hit MCP servers, and reach into mail/Teams/files/calendar in the same run. For example:
- **CRM pipeline hygiene:** Microsoft Scout can proactively identify missing CRM data, sale opportunities, incomplete follow-ups, or mismatched records across systems.
- Submit an expense report (requires sufficient system access): There is no need to input complex prompts or context. Just say “Expense my business travel.” Microsoft Scout will handle that by pulling information from local files, the web, and Work IQ.
- **App and dashboard building:** Let Microsoft Scout help you rapidly prototype internal tools, dashboards, trackers, and lightweight applications by combining enterprise knowledge, files, automation flows, APIs, and business logic into working experiences tailored to a team’s needs.
- **Skills and automation building:** Create reusable skills and automations without starting from scratch each time. Users can teach Microsoft Scout common workflows – like generating reports, organizing files, or preparing customer updates – and invoke them later with natural language.
- **Daily briefings and prioritization:** Microsoft Scout can automatically generate personalized summaries of meetings, emails, documents, tasks, and ongoing workstreams, and suggest/ draft next steps, to help you stay up to date and focus on top priorities.
- **Nightly notes summary:** Ask Microsoft Scout to search through meeting notes from the day and briefly summarize what happened, along with listing any action items with owners. Set this up once, and get it automatically, every day.
- **CRM pipeline hygiene:** Microsoft Scout can proactively identify missing CRM data, sale opportunities, incomplete follow-ups, or mismatched records across systems.
- **Skills and automation building:** Create reusable skills and automations without starting from scratch each time. Users can teach Microsoft Scout common

workflows – like generating reports, organizing files, or preparing customer updates – and invoke them later with natural language.

Why are we making this app available now?

In recent weeks, we have seen thousands of Microsoft employees using an early Microsoft Scout local desktop experience. We built this application so that we could learn how employees are using proactive AI in their jobs. The feedback is clear, our employees love using it and we are going to offer Frontier organizations the same opportunity so that we can learn and build together as we transition to an always on agent running in our M365 service. Access requires Frontier enrollment, Intune policy configuration, and an opt-in attestation. Users with a GitHub [Copilot license](#) can then download and install the experience.

Where can customers learn more about how to use this app?

Customers can visit <https://learn.microsoft.com/microsoft-scout> to learn more about how to use the app.

3. PLATFORM, ARCHITECTURE & GOVERNANCE

Is Microsoft forking OpenClaw?

No. Microsoft is making active additions to the open source OpenClaw infrastructure to harden it at the source. That includes work on policy conformance, diagnostics, auditability, sandboxing, and attestation, so enterprises can better understand, verify, and govern how agents operate. Our goal is not to build a closed Microsoft fork, but to help make the underlying OpenClaw platform more secure and enterprise-ready for everyone.

4. GO-TO-MARKET & SELLER GUIDANCE

What is the licensing model?

We do not yet have licensing model information to share.

How do customers join Frontier?

Customers can learn more about joining Frontier at this site: [Get Started with Frontier for Business Users | Microsoft Frontier](#)
